

Surface Design 1

MAAD 2009

Ana Galindo

“High resolution” film

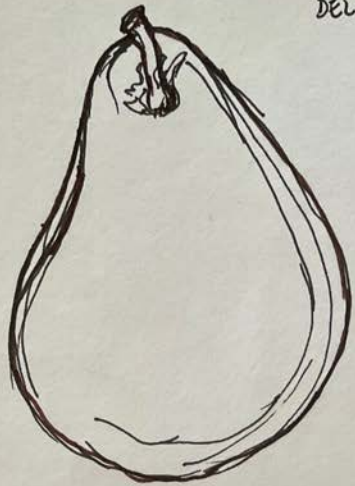

Also known as transparencies, acetates and certainly ***positives***, these are transparencies used in screen-printing and other print disciplines to create a photo stencil.

If correctly set up digitally, they have true blockage and shave a big chunk of time during the prepping activities.

At this point you already know that screen-printing is all about the prep, the actual printing is the fun and much quicker part of the overall process.

Here is a step-by-step guideline on how the positives for today’s demonstration were generated

PERA EN ESPERA
...
DEL "LONCHE"

estas siluetas pueden
funcionar muy bien para
un repeat — como des-
contextualizado de la
colina?
DIBUJAR LA PERA ANTES DE
COMERLA...

color en porcentajes

Original hand-drawn pears.

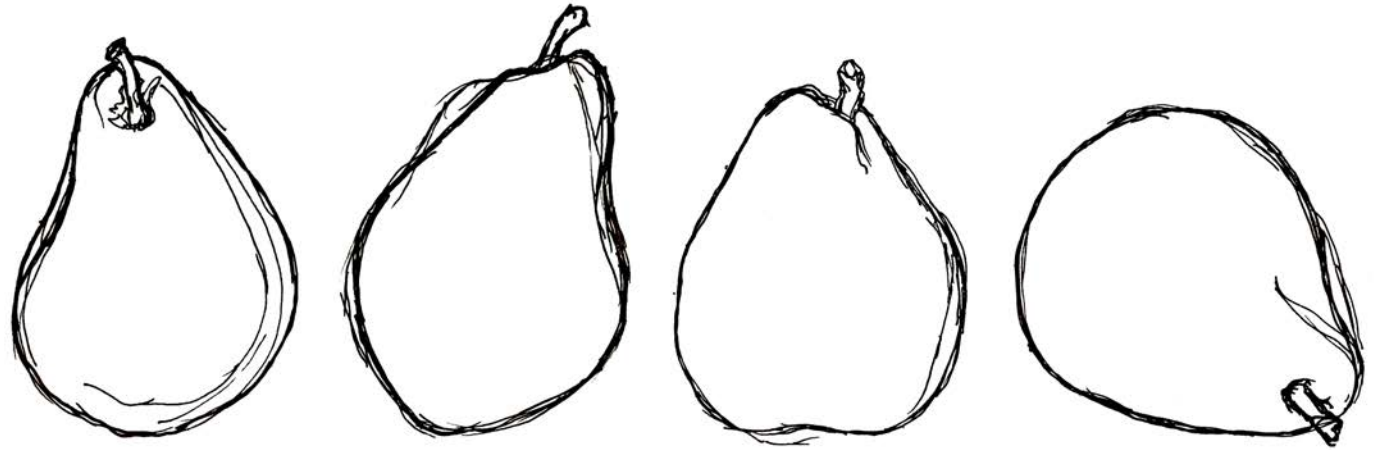

PERA EN ESPERA
...
DEL "LONCHE"

estas siluetas pueden
funcionar muy bien para
un repeat - como des-
contextualizado de la
colina?
DIBUJAR LA PERA ANTES DE
COMERLA...

color en portatiles

Contrasted pears in Photoshop under *Image*:

- Adjustments
- Brightness/Contrast
- Curves

open the file in Ai

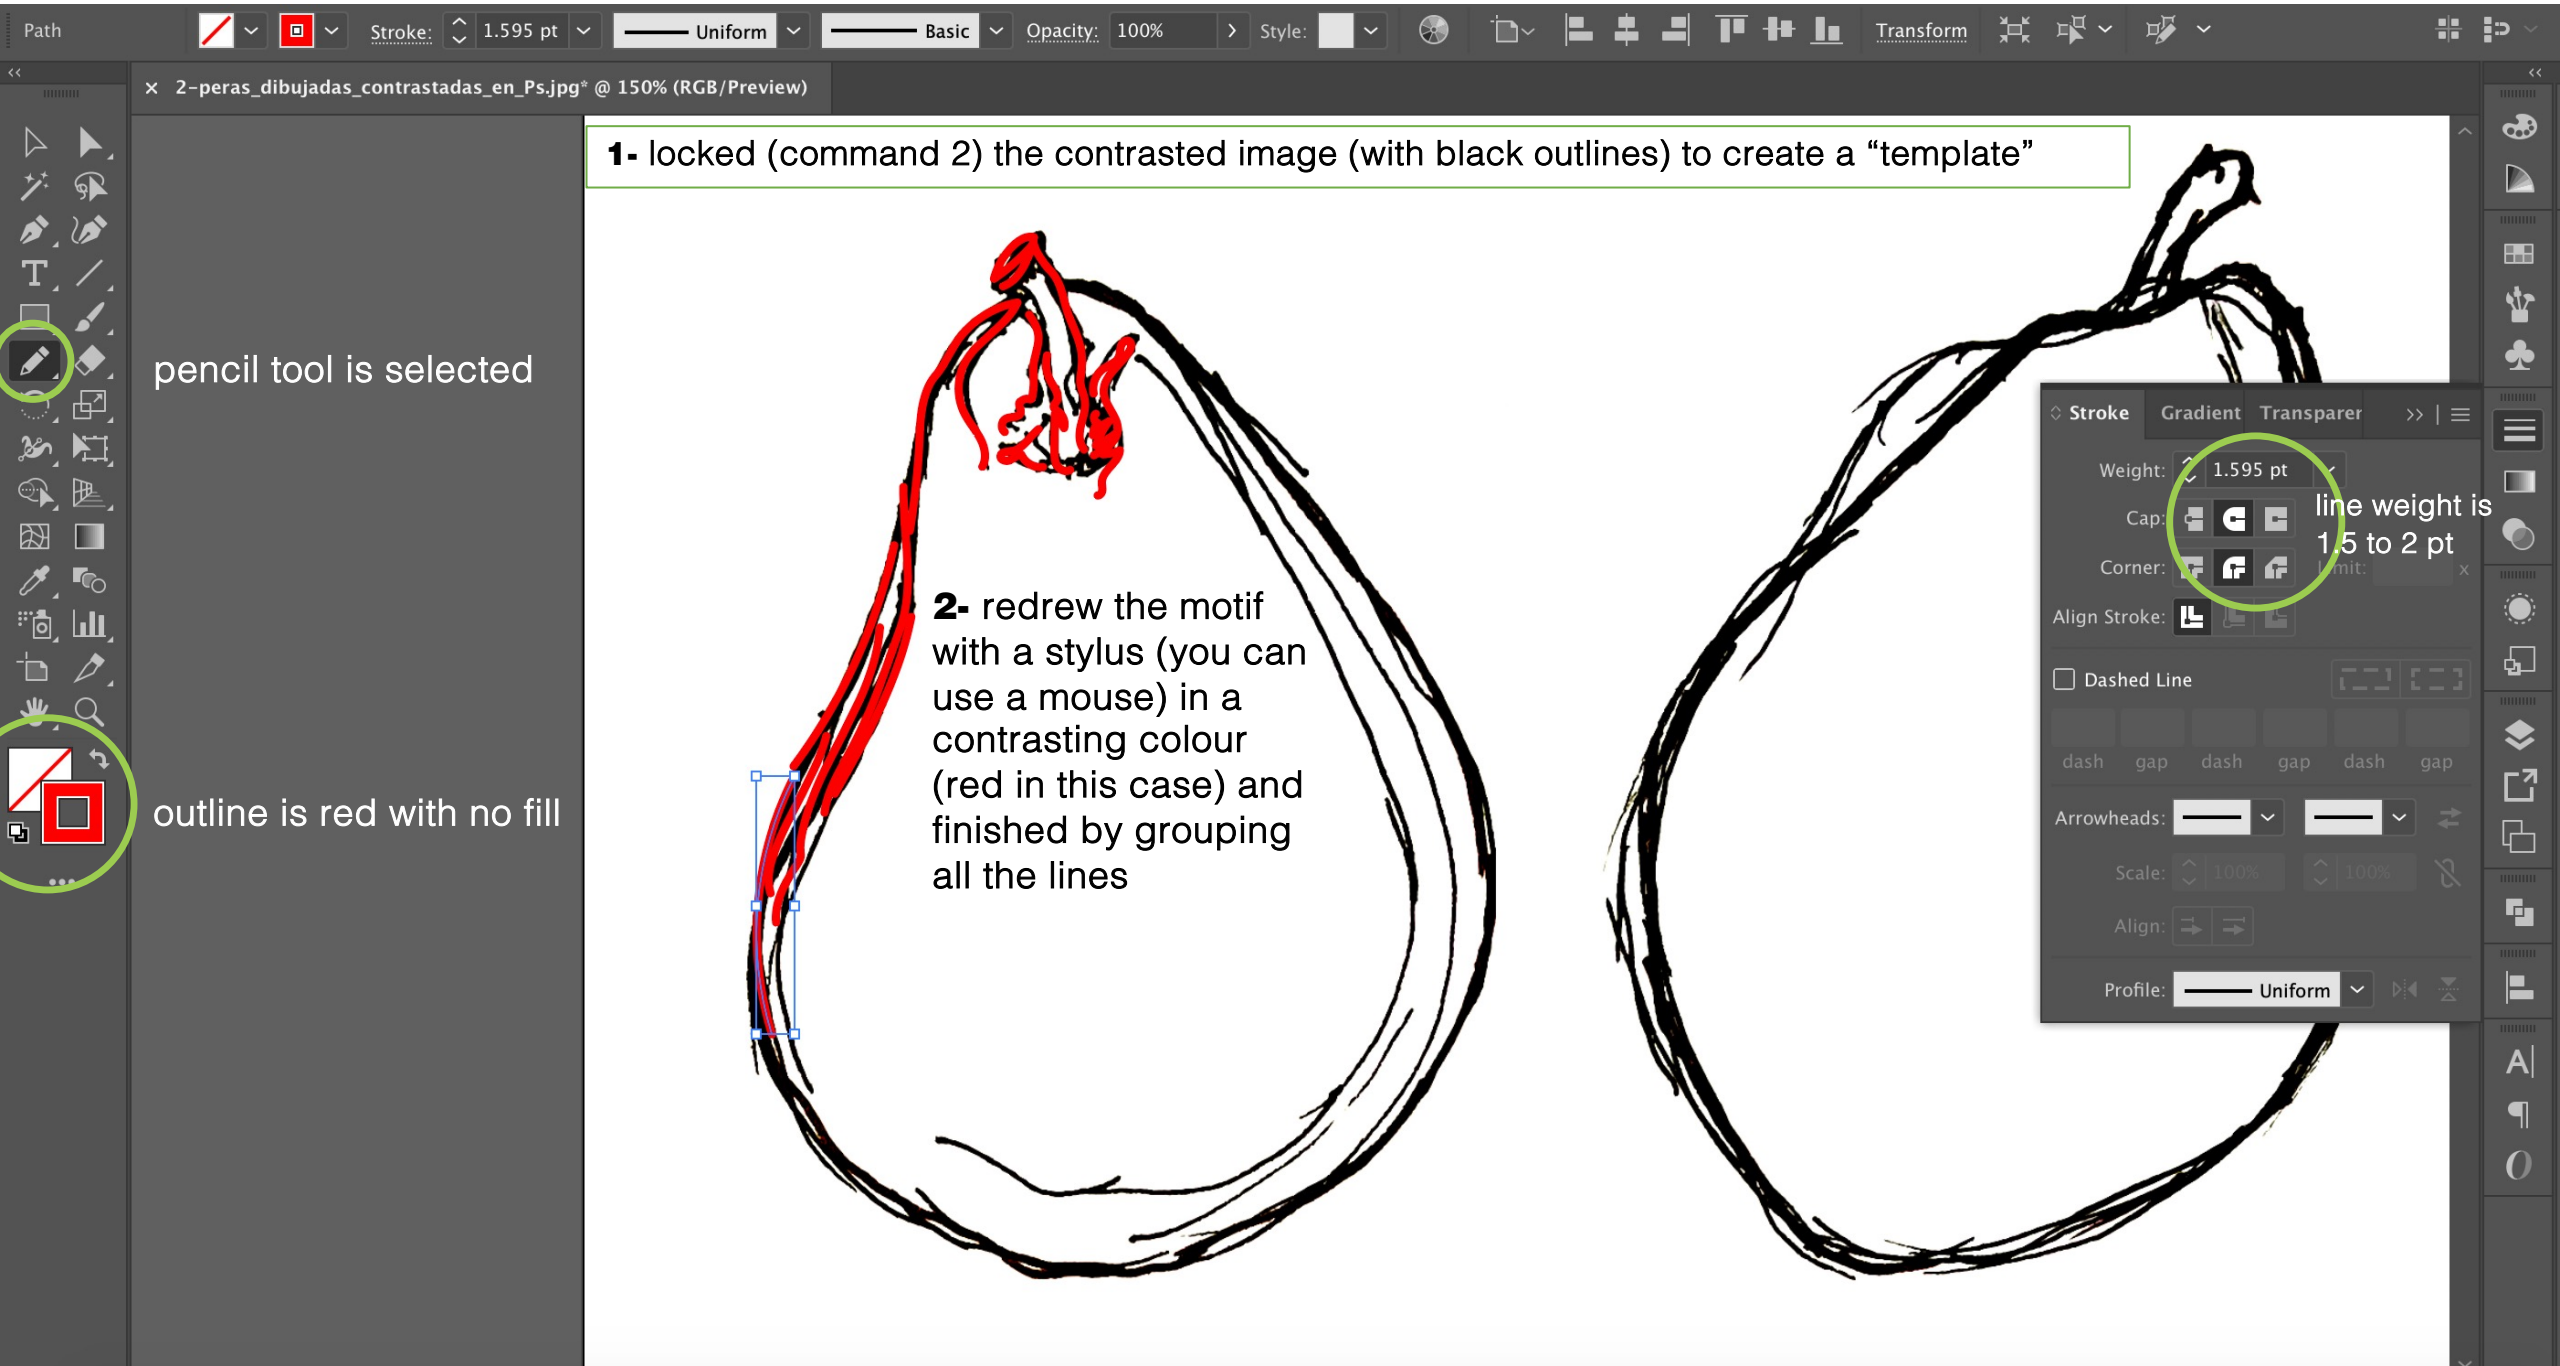

and either proceed to select the image and go to object:

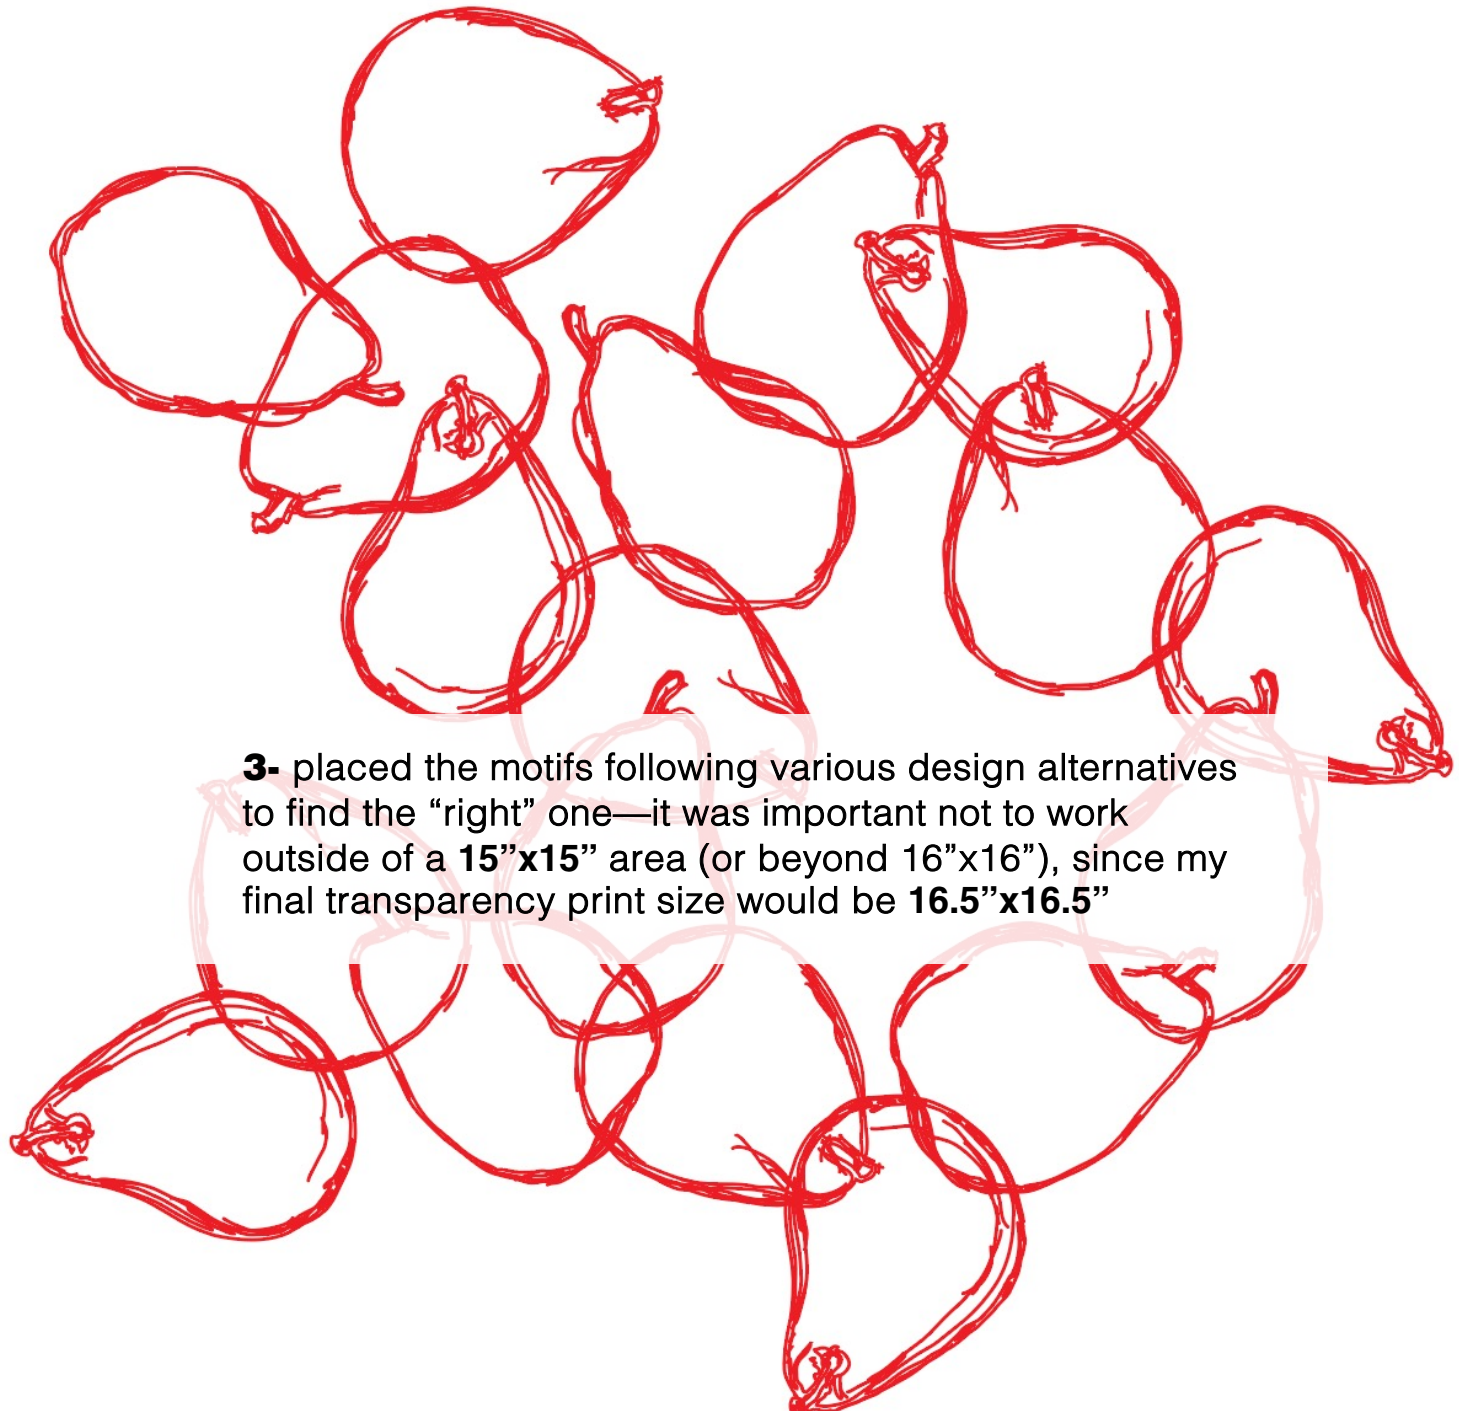

- image trace
- make and expand

(I didn't do this)

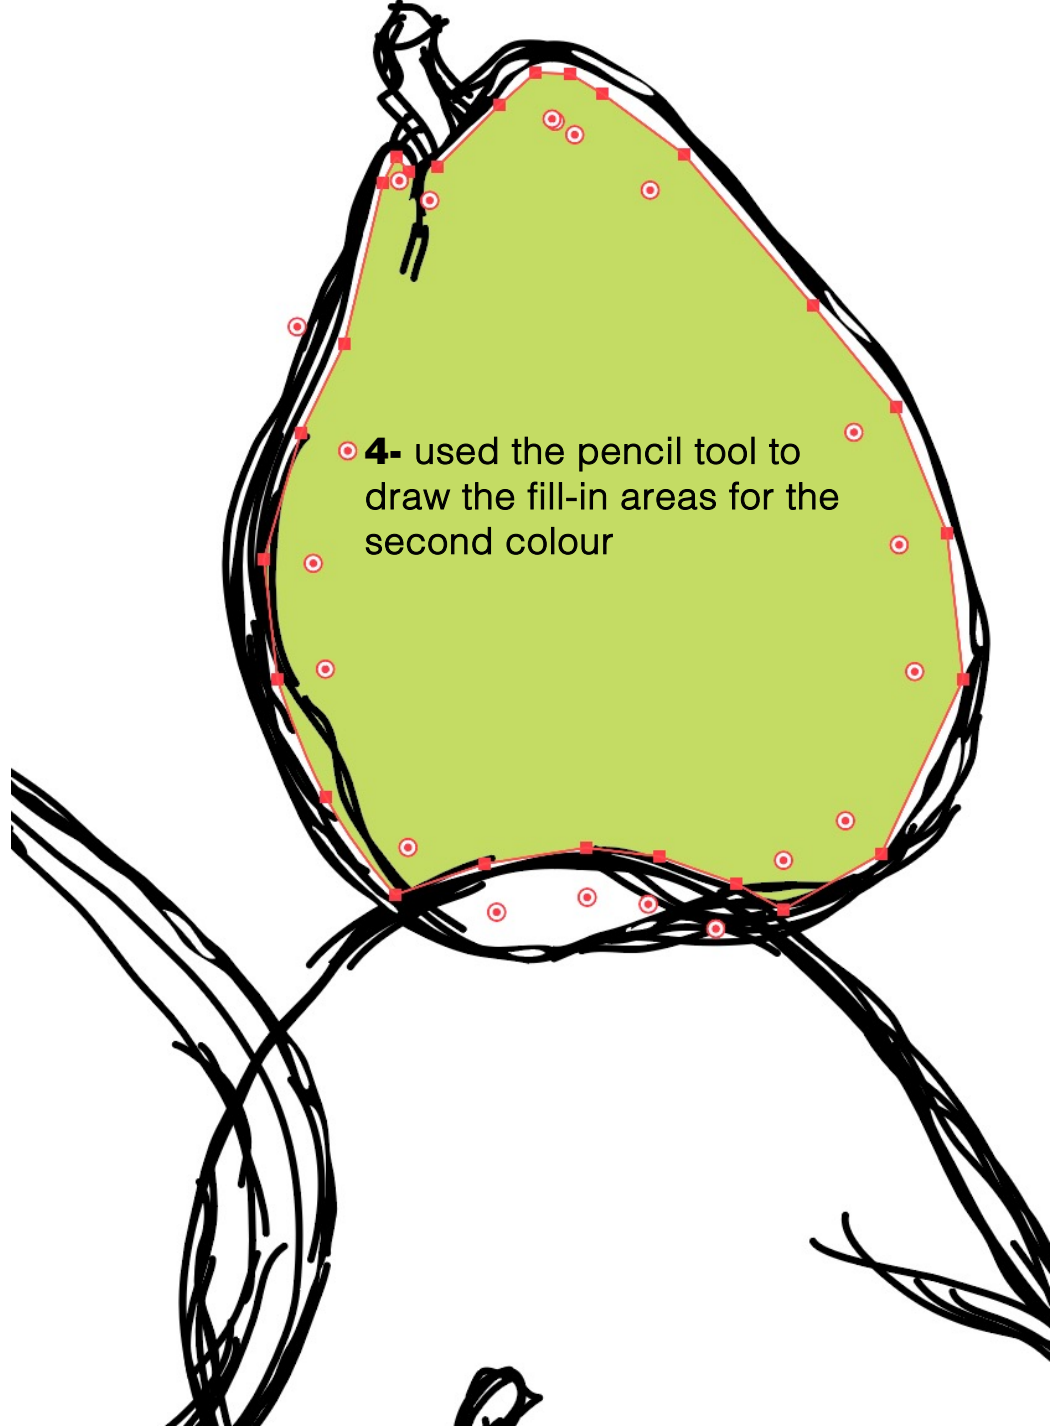

or...

open the contrasted Ps file in Ai (which is what I did)

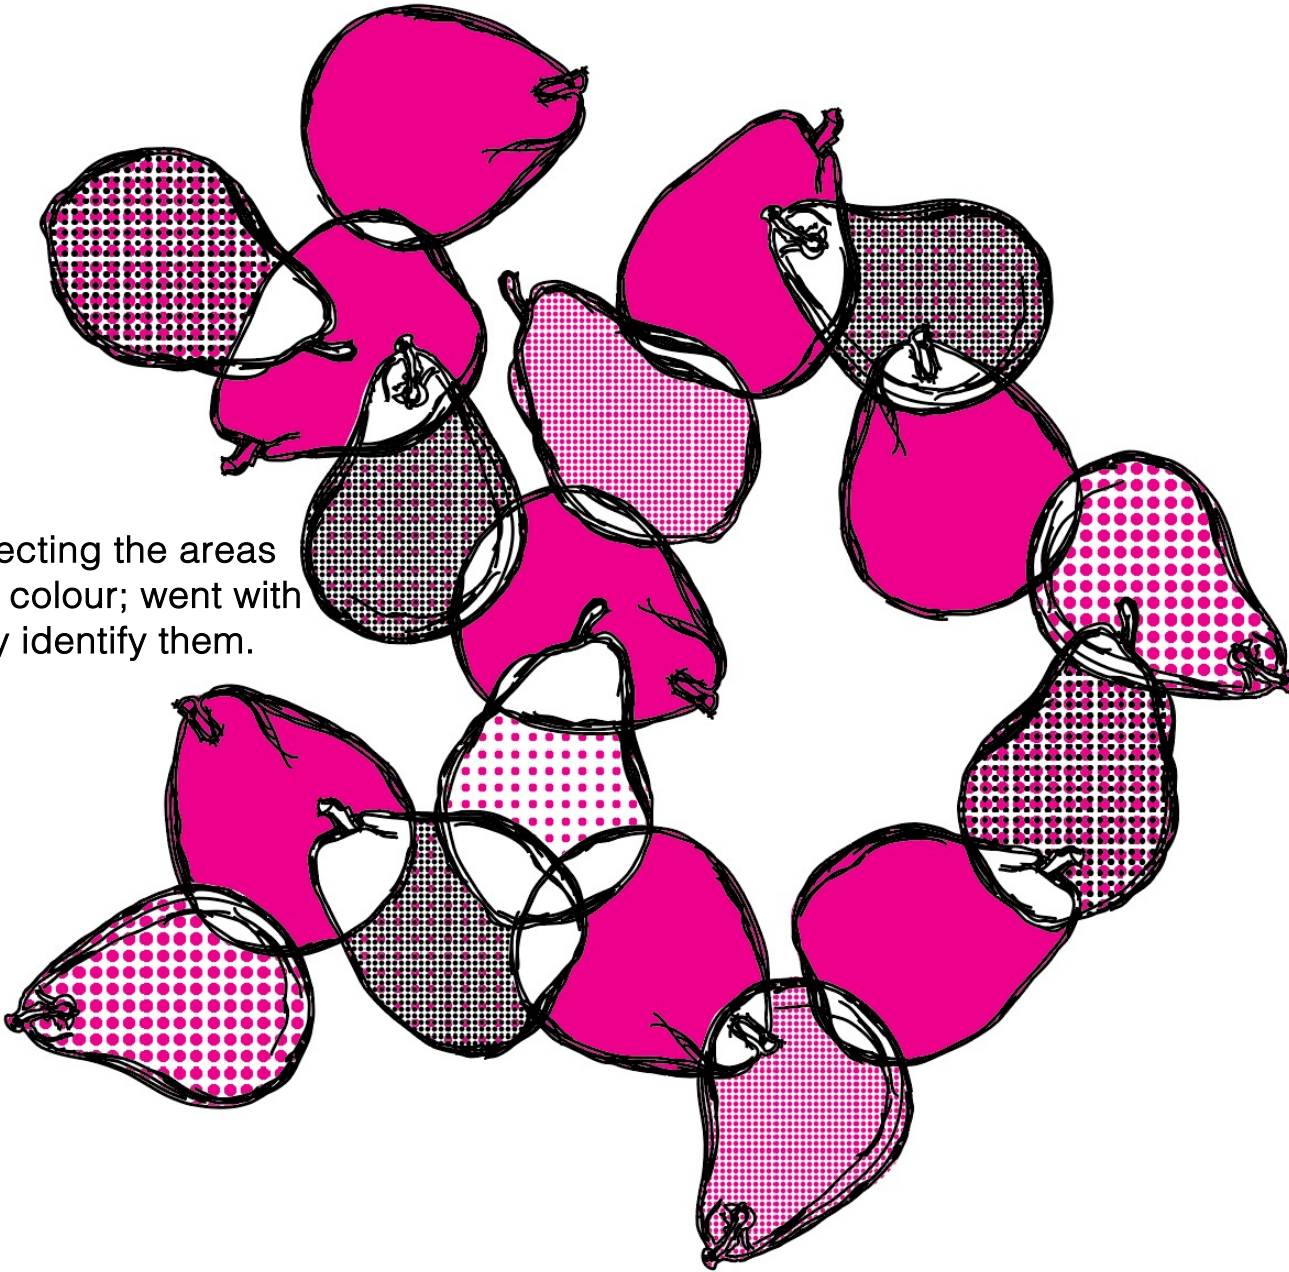

3- placed the motifs following various design alternatives to find the “right” one—it was important not to work outside of a **15”x15”** area (or beyond 16”x16”), since my final transparency print size would be **16.5”x16.5”**

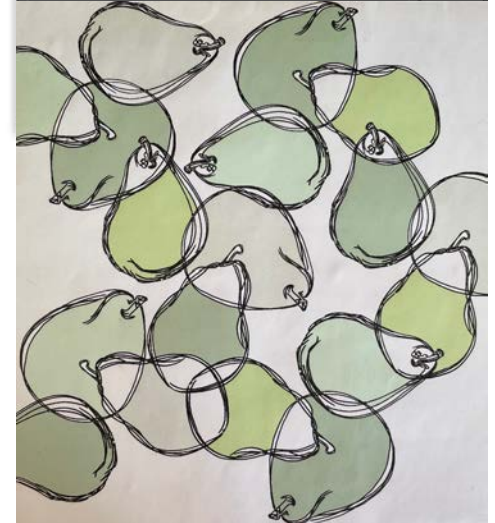

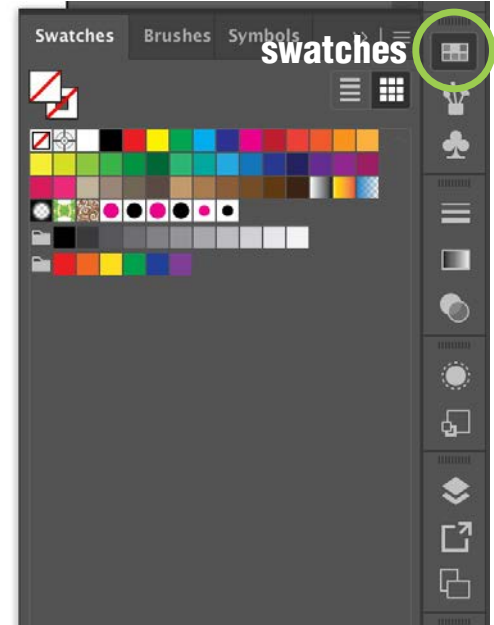

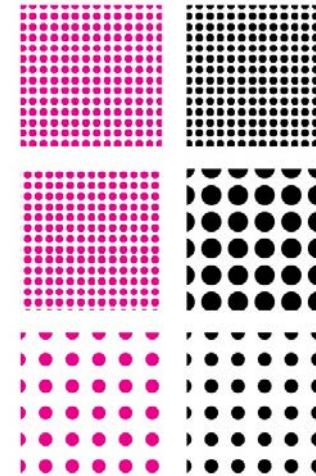

4- used the pencil tool to draw the fill-in areas for the second colour

5- finished selecting the areas for the second colour; went with hot pink to fully identify them.

6- generated “mock half-tones” in Ai (as demonstrated in class) and filled in the areas following the design ideas in the sketchbook

WITH NO TRAPPING

if registration is not perfect,
a gap between colours may
be visible

WITH TRAPPING

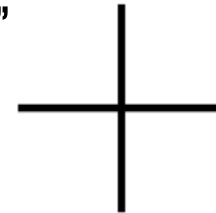

see how the pink goes a
bit over the black line
(when ideally it is
usually under it) but
here it's shown over to
appreciate the effect

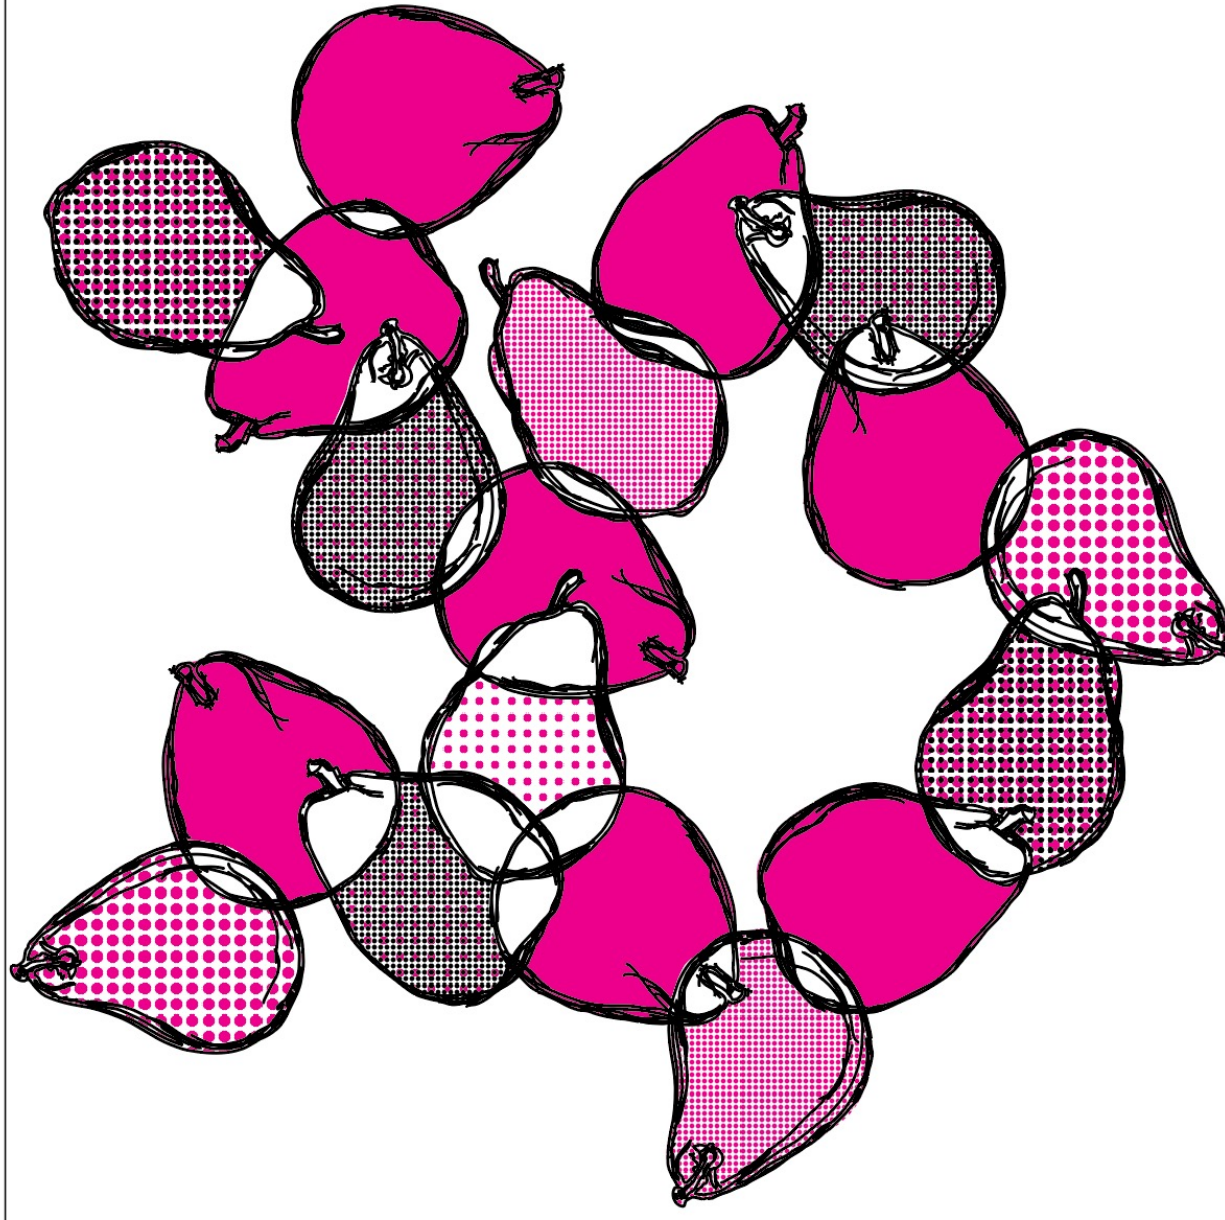

this is a good moment to talk about

TRAPPING: for gapless printing; help avoid “off-registration” effects

REGISTRATION MARKS:

- ❖ for registration printing, make sure the registration marks exist outside the “effective” print area, in our case, outside the sewing territory—the preferred shape in this instance are the squares
- ❖ they are very helpful in the “squaring” process before shooting the photo stencils; this means they help us make sure they are *parallel* to the top and side edge of the silkscreen frame in preparation for yardage registration printing—the preferred shape in this instance are the “crosses”

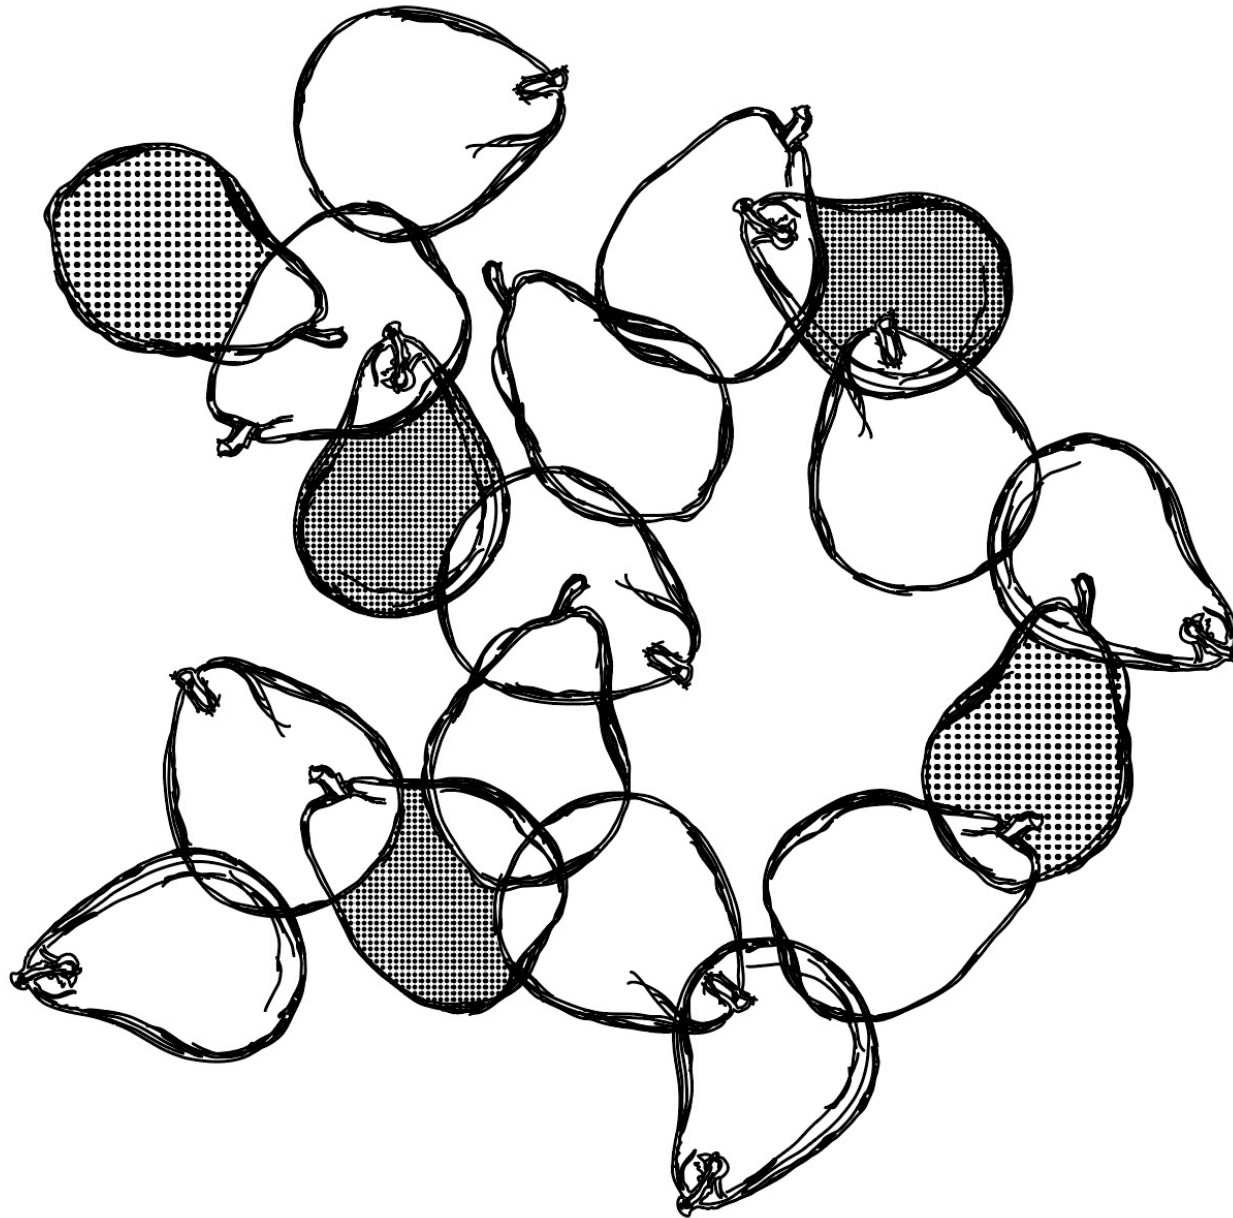

7- proceeded to generate the preliminary file with registration marks (in this case squares) and titled it before separating the colours for the final output, that is printing on transparencies

the squares are a quarter inch and are outside the 16"x16" print area, so that:

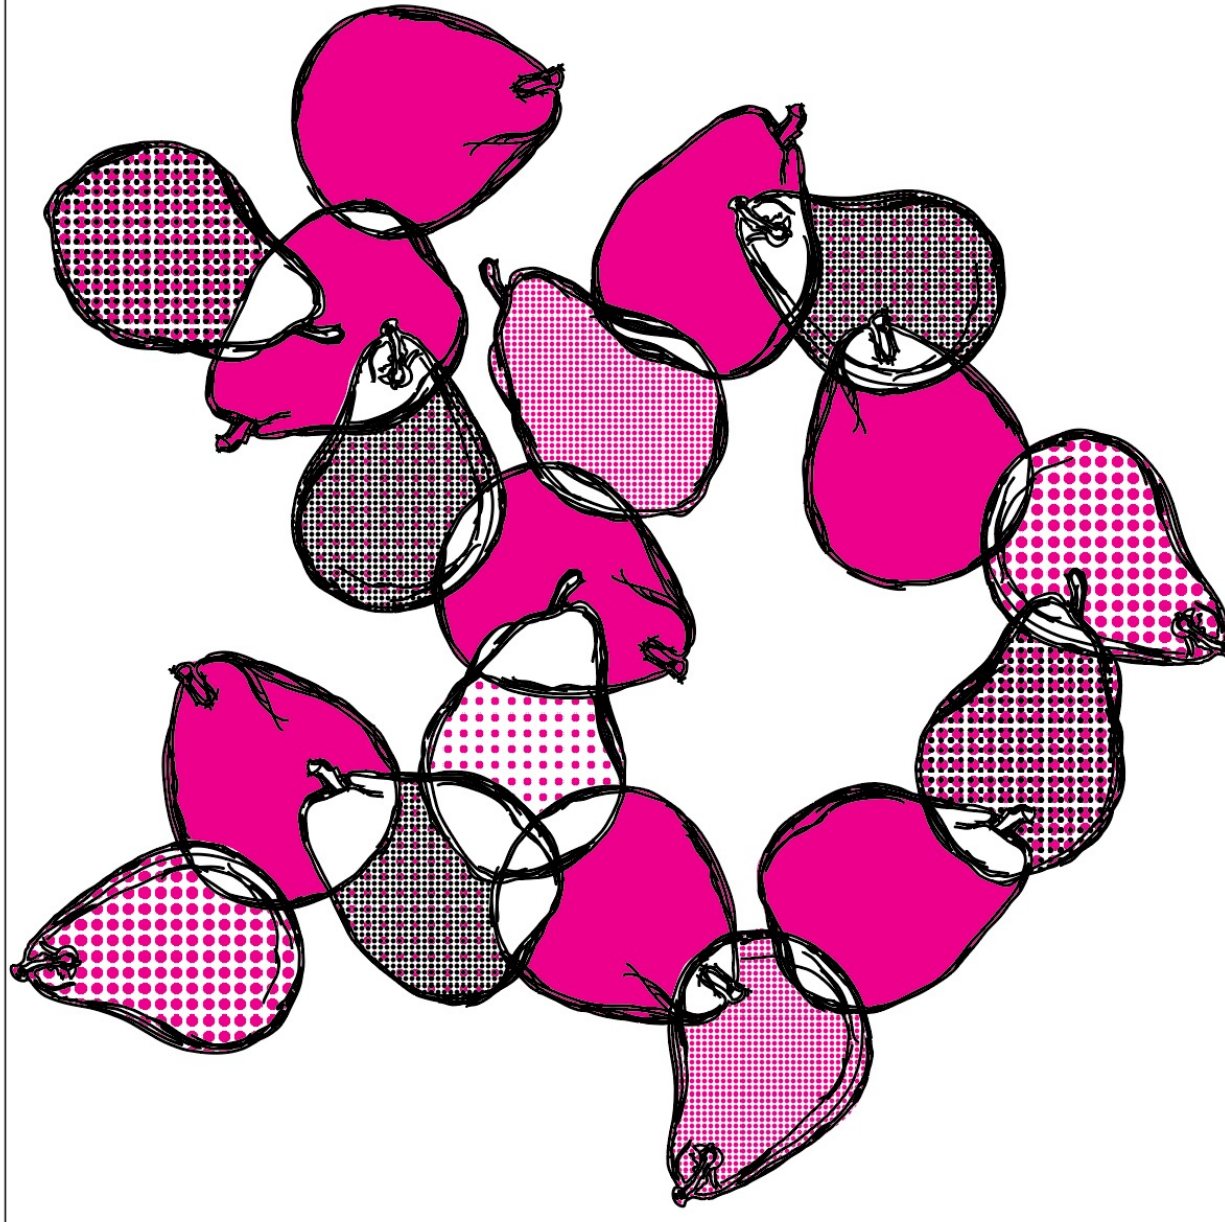

- my final file size is **16.5"x16.5"** simply because that is what G&S Dye requires (if you send it to another service bureau ask about their printing output for large files)
- the squares are outside of the sewing area in order to be safe when the time comes to put together the cushion covers

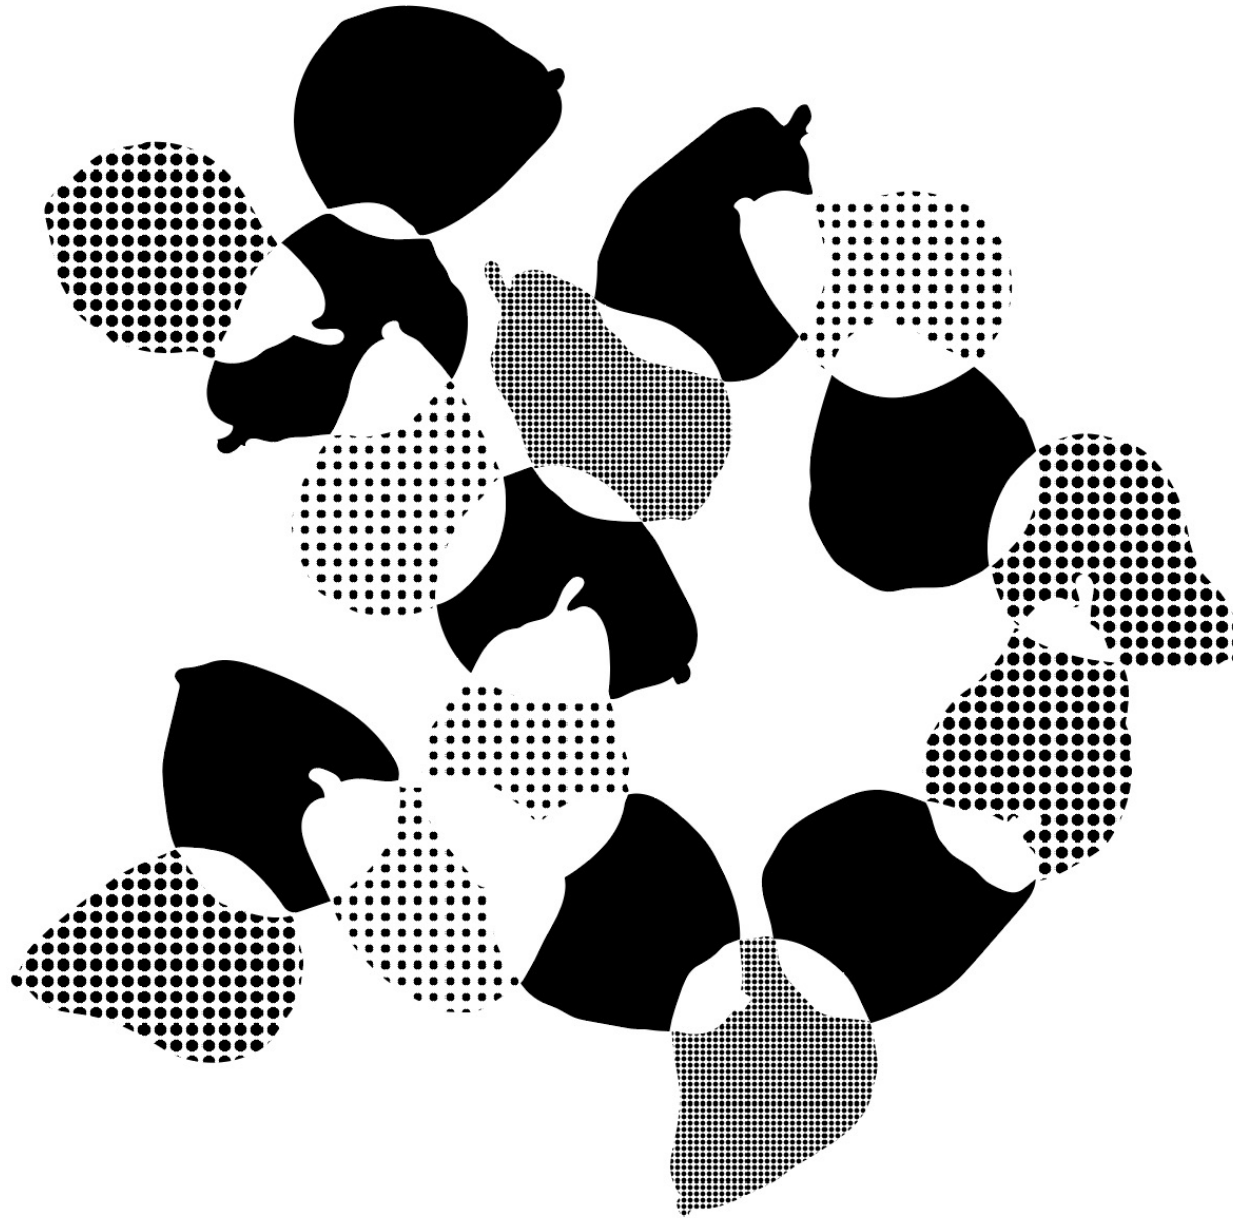

8- removed all unnecessary lines and selected only those elements needed in the foreground colour (black in the previous slide)

identified it as **c1**

saved this file under a different name, and for easy location the words “foreground colour” were used in the file’s title

9- went back to the original file and selected only those elements needed in the background colour (in this instance those in hot pink)

10- once again, removed all unnecessary lines and made sure to identify the elements needed in the background colour (hot pink in the previous slide)

identified it as **c2**

saved this file under a different name, and for easy location the words “background colour” were used in the file’s title

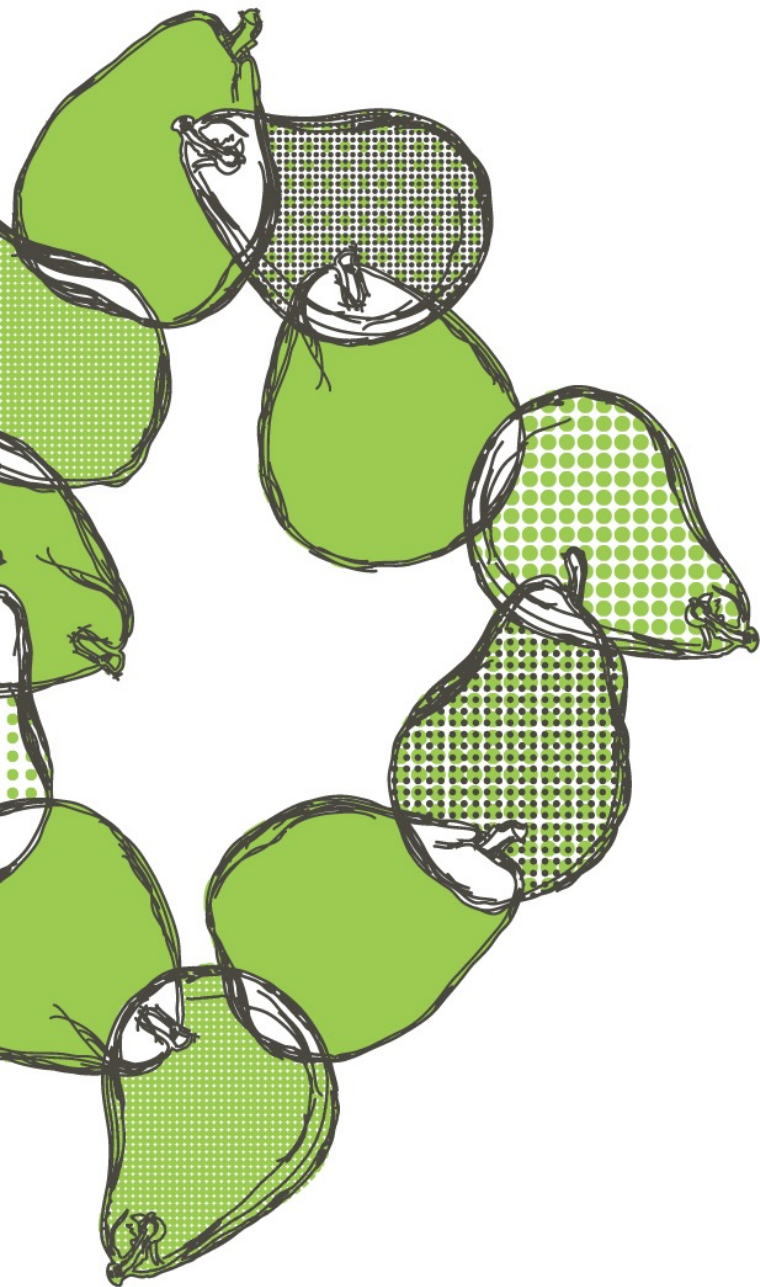

saved both files as pdf

and sent them to the service bureau

this is one way to do it,

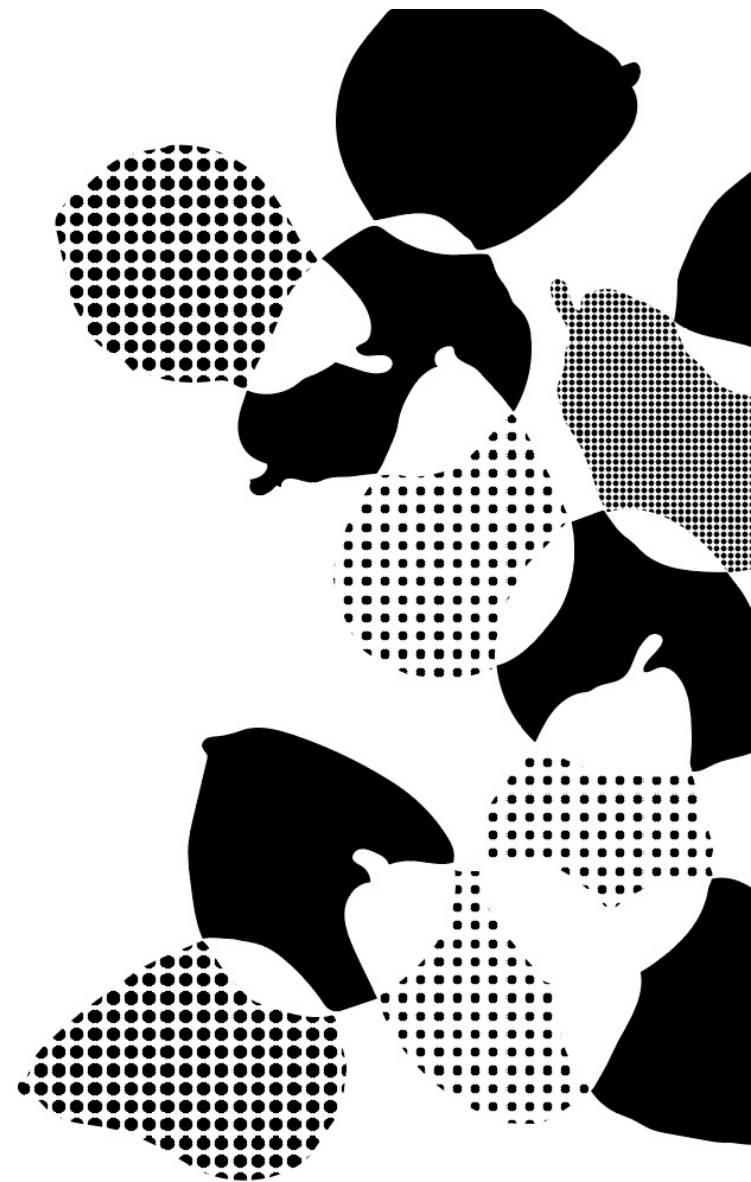

meaning, this is the method that works for **me**, you can resolve the positives any way you find convenient, just remember, you need one positive for each colour you intend to print and don't forget the registration marks as they will be very important in the printing process

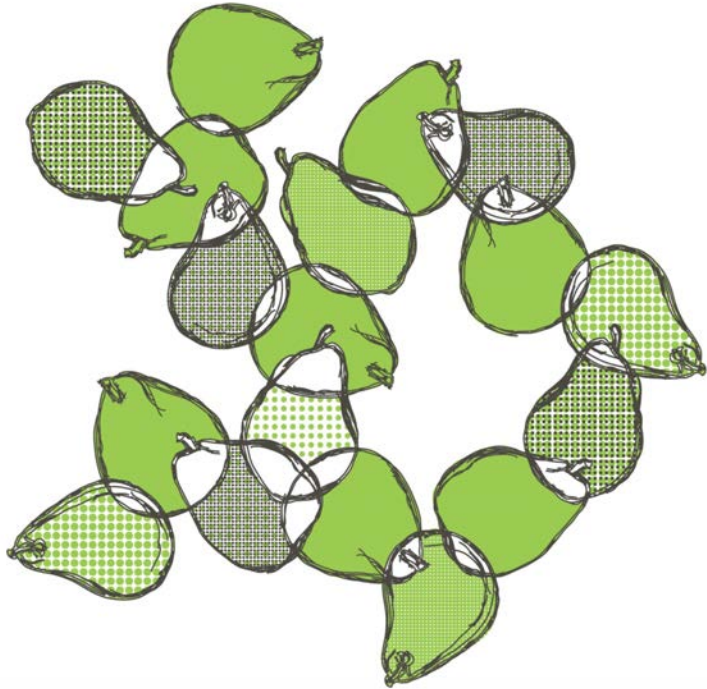

the registration marks can be crosses, or squares or circles, or anything, really—my only suggestion is to keep them while printing in order to register each colour as originally planned, just place them outside the sewing area

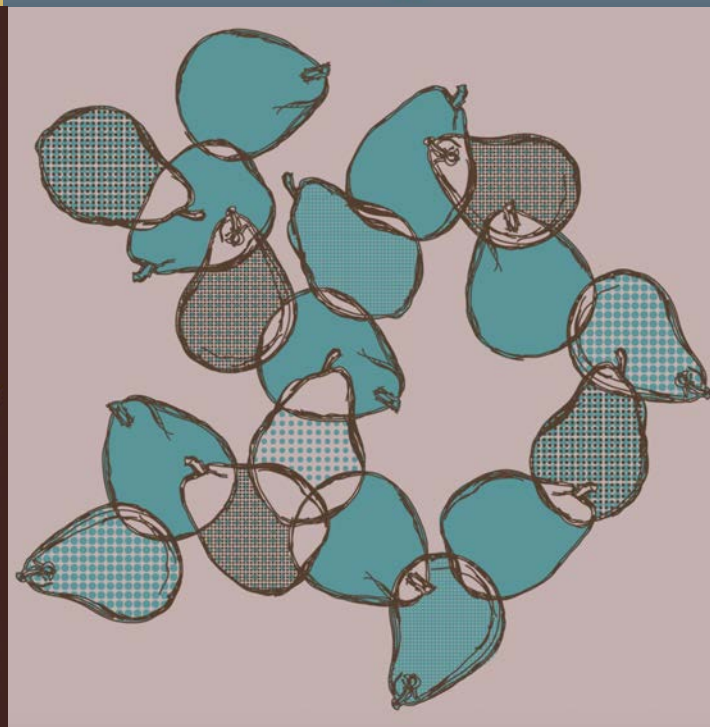

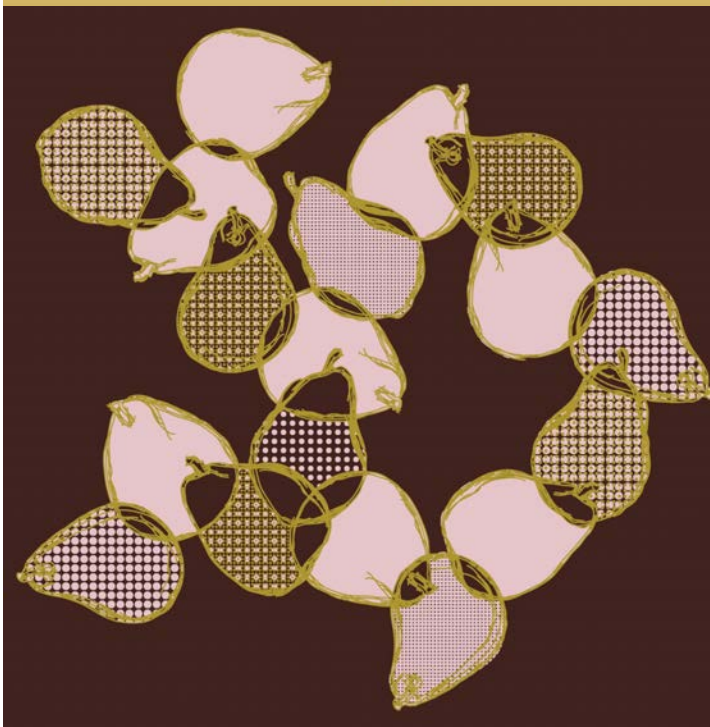

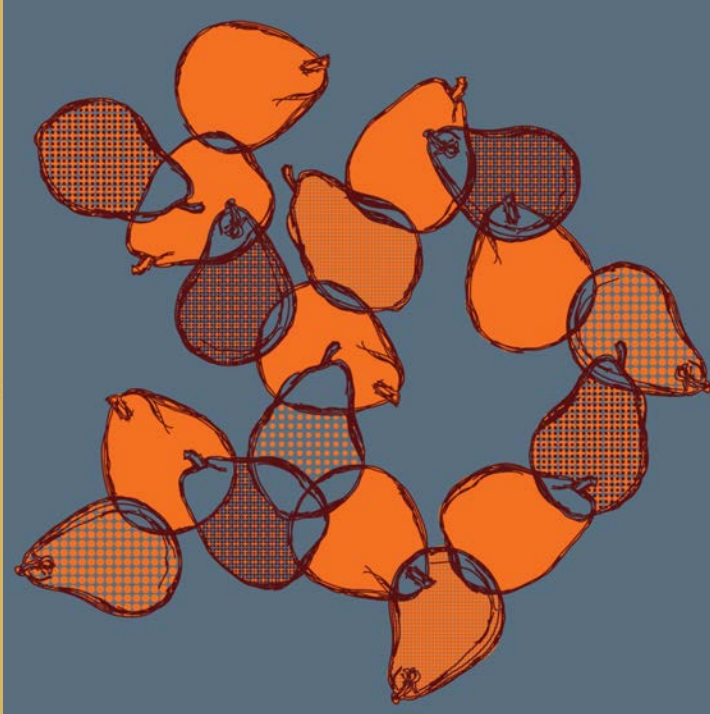

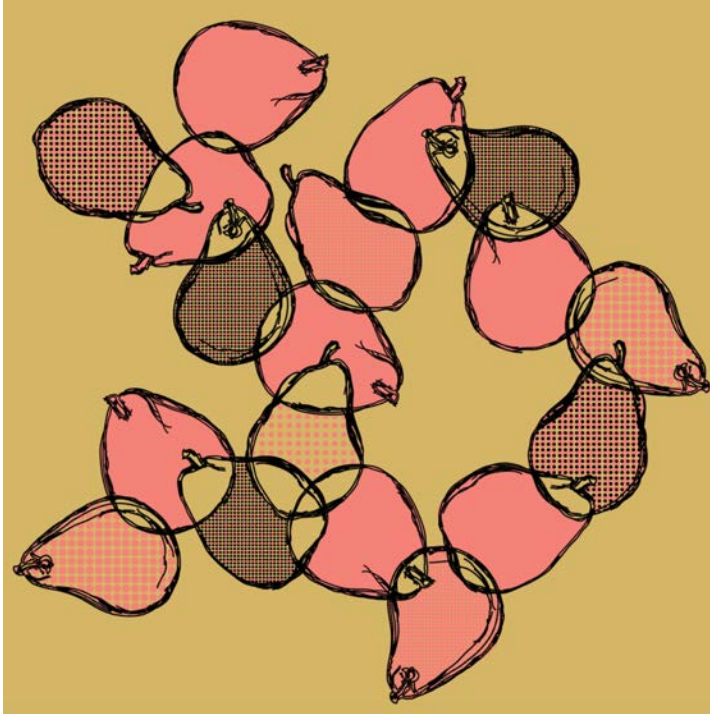

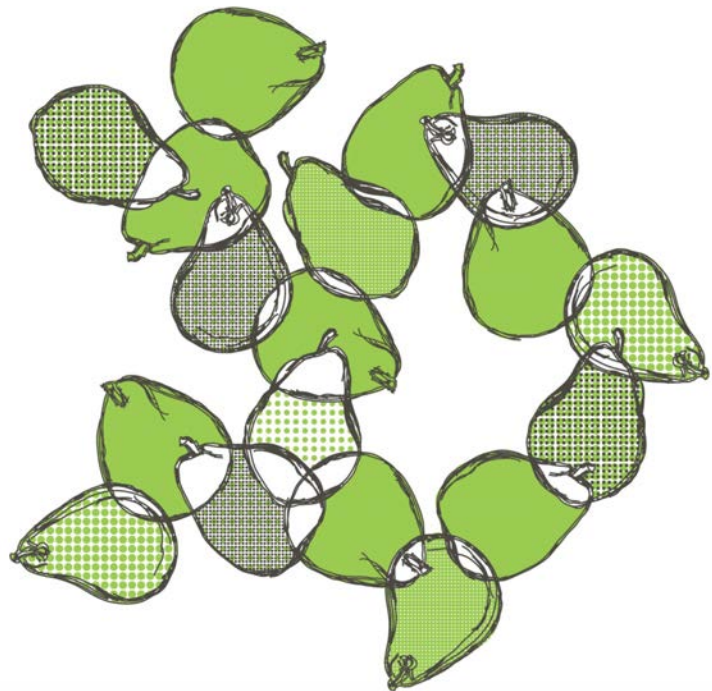

bonus

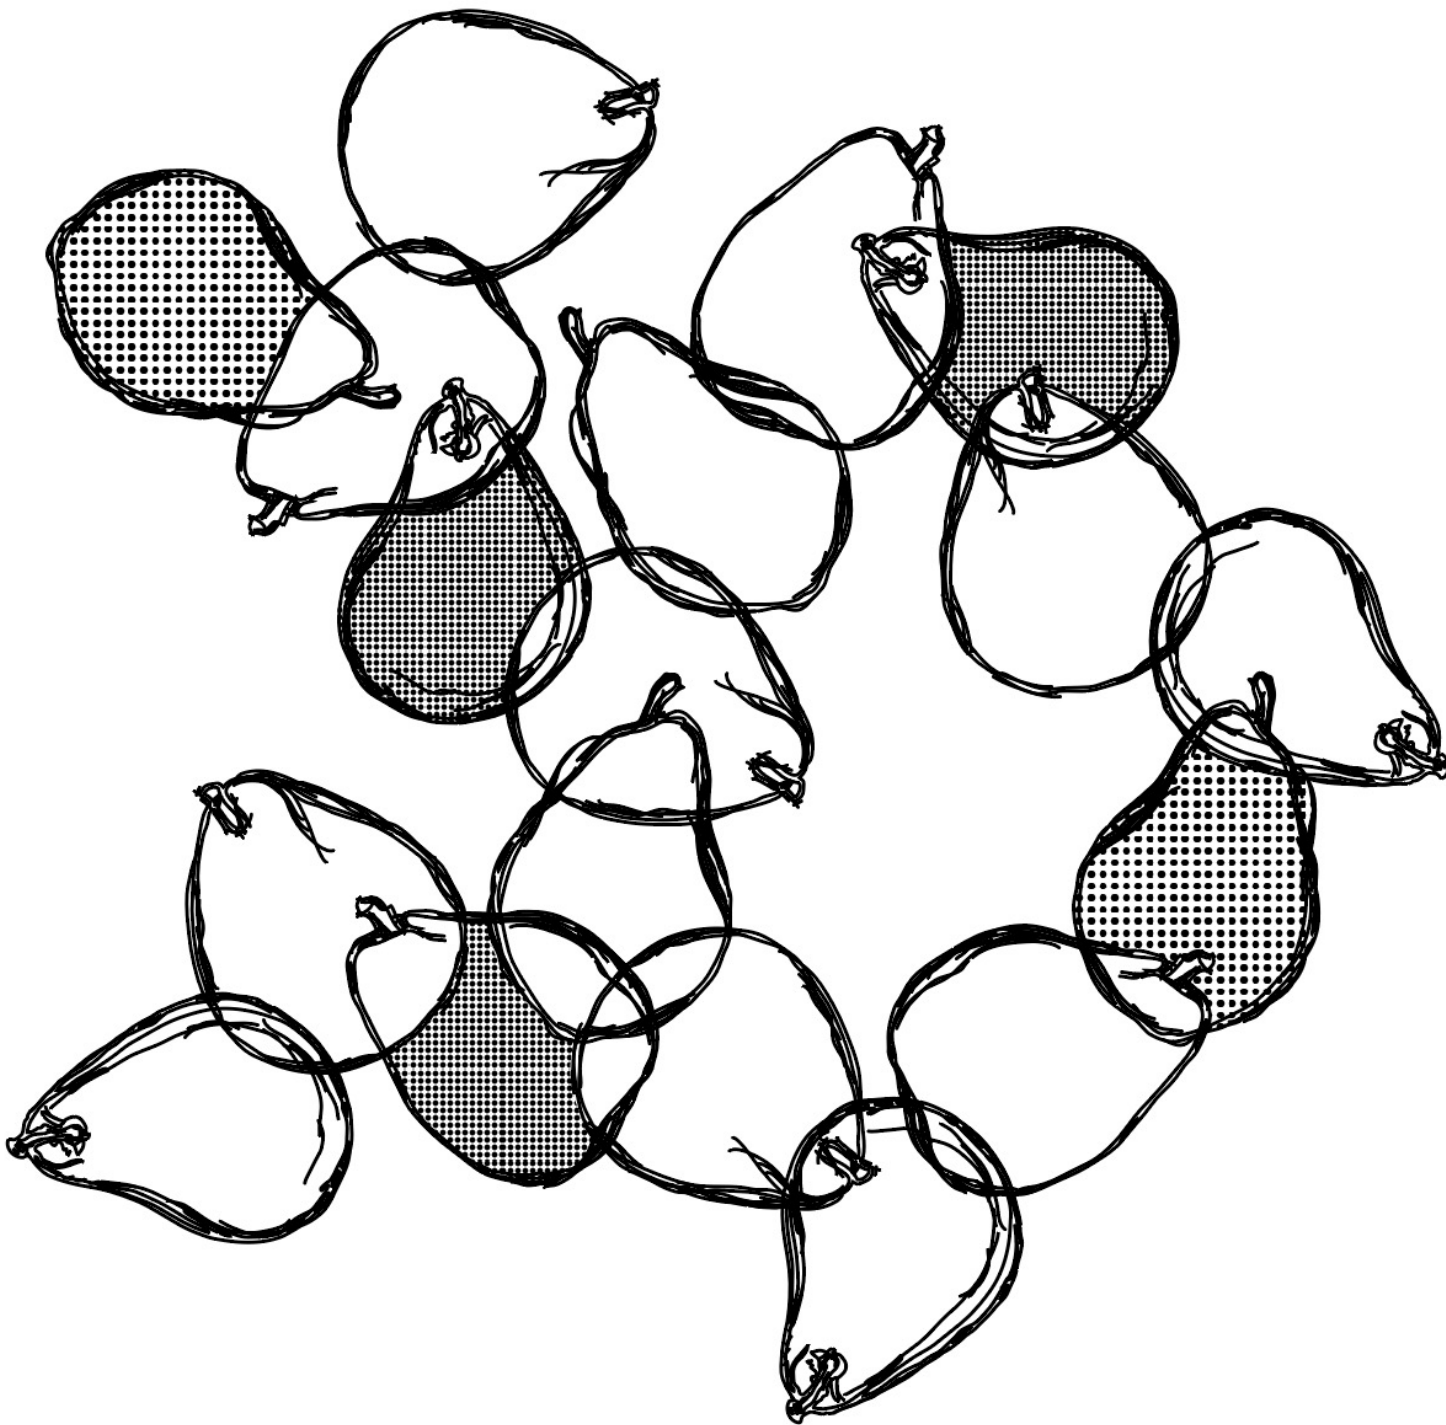

colourways in Ps

using the simple methodology seen previously in class with photoshop, generating colourways is the easiest way to decide on the final colouring for our prints, meaning, you can get to the printing table having made informed decisions for the design's colourways

Thank you.
